

Product line factsheet

EDIBLE NUT
by JATRO SOLUTIONS

Salient cultivar features of

EdibleNut:

- No phorbol esters
- Favourable fatty acid composition
- Favorable amino acid composition
- Concentrated harvest period
- Reduced plant size for easy harvest
- Adapted to diverse environments
- High yield stability

* Sources:

Chuta: own data; other nuts: USDA National Nutrient Data Base

Cultivars completely lacking phorbol esters provide the basis for **EdibleNut**. Delicious snacks and other foods can be produced from seeds and kernels. Another possibility is the extraction of oil that can be used for cooking. The remaining press cake or kernel meal can be channeled into production of protein powder. A highly favourable fatty acid and amino acid composition guarantees a high nutritional value of all **EdibleNut** products.

Please note that conventional cultivars mostly outyield edible cultivars as these show a better adaptation to a wider range of environments. However, high-end products suited for human nutrition can be extremely profitable.
